Questions submitted during the webinars

Questions		Answers
Are roughness, elevation and climate available for the Netherlands? Is this downloadable from module Basis?		Yes. Pretty much all of Europe is covered by the usual databases like SRTM, DataforWind, Corine Land Cover, MERRA, EMDConWx, etc.
As far as I see, while creating a new project from the project wizard, height contour, background maps & roughness are loaded automatically, In that case what is the default background roughness value		The items that you have checked are loaded (you can always uncheck what you don't want). The background roughness defaults to zero, so you will need to set it yourself.
Before double clicking a layer opened the properties menu. Would it be possible to introduce this again?		If you double-click a layer, you will get the layer properties for that layer
Did the project examples change?		Some did as we are trying to add examples that are newer and more relevant to modern day projects
I am using 2.9, if I update to new 3.0, do I need to buy a new licence?		If you have an active service agreement, the upgrade will be free. If not, you will need to purchase a new license. Contact Sales for information: sales@emd.dk or check our web site for standard pricing
Is there any possible to get the all the available co-ordinate system in one window		If you click "Select" and then uncheck the box "limit to commonly used in country", the drop-down list will then include every system in windPRO. There is currently no way to export that list.
How can I rename an existing folder in the object layer?		If you click and hold for a second, the layer name will become able to be edited. This is the same for most columns in the Objects List as well.
If I close a map clicking "x", how can I make it visible again?		Open the Project Properties window and re-check the box next to the map name
Is it possible in 3.0 to convert existing WTG into new WTG or shadow points to acoustic points?		Unfortunately, no… you cannot change the type of object. However, you can copy to Excel and re-paste back into windPRO without the type designation. windPRO will then prompt you to choose the object type.
Is there support for systems with two or more monitors?		windPRO can be sued across as many monitors as your system allows. You can drag window panes out and make them "free floating", then position them where you would like across screens
Is there any specify reason to change the WindPRO starts with small letter "w" windPRO		It was a marketing decision. Feel free to contact them to find out why: sales@emd.dk

Are changes now stored automatically?	In regards to the Undo functionality, changes are stored temporarily on your hard drive in a windPRO sub-folder. That folder is cleared when windPRO is closed.
Could you clarify which country is available for WMS? I am working on Portugal and Spain but it popped up "unable to download map" every time.	The availability and integrity of databases is different from country to country. If you feel there is an error, contact support and we will look into it: support@emd.dk
Can we open two projects at same time in version 3.0?	Unfortunately, no. It is being considered but there is a LOT of hurdles to making that happen.
Is there a way in this new version for applying a time shift in the wind data series?	You can change time zone in the METEO and that will create shifts of 1hr increments (or whatever increment that time zone is). You have more functionality of shifting series in MCP on the Measure tab. Performance Check allows shifting resolution of up to 1 minute, but it is for turbine production (SCADA) data.
